

C1000-207_Practice_Exam_Set2_AnswerKey

Practice Exam SET 2 — Answer Key & Rationale

Q	Answer	Why
1	B	Orchestration's value is coordinating specialized agents/tools across a complex, multi-step process.
2	B	Software Hub underpins licensing/deployment for Orchestrate in hybrid/on-prem setups.
3	B	Knowledge Bases store reference documents for grounded retrieval.
4	B	ADK is for custom development when catalog assets don't already cover the need.
5	B	Unstructured, non-repeatable judgment calls are explicitly NOT suitable for Orchestrate.
6	B	Human-in-the-loop task automation + cross-system orchestration is a stated value scenario.
7	B	Dependencies/handoffs reveal where the process crosses systems/owners, informing design.
8	B	Governance, scalability, and security apply across all platform capabilities, not just one environment.
9	B	Correct distinctions: Assistants (conversational), Agents (autonomous), Collaborator Agents (internal, invoked), External Agents (other platforms via A2A).
10	B	Collaborator Agents enable decomposition/delegation of subtasks — modularity and reuse.
11	B	Use external A2A agent configuration via ADK to integrate an existing third-party agent.
12	A	Multi-Agent Orchestration explicitly supports incorporating agents from watsonx.ai.
13	B	Langflow = visual/node-based; Agentic Workflows = WXO-native flow-building constructs.
14	B	Configure via ADK (Start ADK), then integrate into a WXO agent.
15	B	HR workflows and Sales prospecting are the named real-world multi-agent orchestration examples.
16	B	Identify the specific use cases/tasks the integration needs to support before implementation.

17	B	External agent = outside W XO on another system; Collaborator agent = W XO-native, internally invoked.
18	B	The Agent Catalog is where you discover existing reusable agents/assets.
19	B	Langflow's visual builder can accelerate prototyping/integration for low-code-preferring teams.
20	B	W XO documentation lists supported agent types including third-party, watsonx.ai, and external A2A.
21	B	Decision points are branch points based on conditions/data/approvals.
22	B	A user activity requiring approval implements a human-in-the-loop sign-off step.
23	B	MCP's value is a standardized, reusable tool/data-source interface vs. one-off custom integrations.
24	B	Correct order: register with MCP server → validate with MCP Inspector → import via ADK → configure consuming agent.
25	B	ContextForge MCP Gateway centralizes exposure/consumption of MCP tools.
26	A	HR and Sales prospecting are the named pre-built domain agent example categories.
27	B	Customizing a pre-built agent requires configuring secure connections to enterprise apps.
28	B	Correct flow: Trigger → sequence of actions → decision points → outcomes.
29	B	Static, unchanging reference content is best served by knowledge base retrieval, not raw LLM guessing.
30	B	Agent design inputs: purpose, scope, expected output, tools, knowledge bases, connections, data dependencies.
31	B	UX/conversational design principles address tone, clarity, and accessibility.
32	B	This mapping ensures the right platform construct implements each part of the process.
33	A	Build process structural elements = tools, connections, metadata, knowledge bases.
34	B	Evaluation metrics quantify performance (accuracy, completion, relevance) against test data.
35	B	Testing and production observability both inform ongoing understanding of real-world performance.
		Chain-of-thought, few-shot, and

36	B	role/task framing are recognized agentic prompting techniques.
37	B	Prompt evaluation should use structured datasets/user stories against defined metrics.
38	B	Broad tool access + untrusted input is a classic prompt-injection/tool-misuse risk vector.
39	B	Channel testing should confirm correct, secure, consistent behavior per channel's constraints.
40	B	Orchestrate Copilot streamlines workspace setup/dev tasks via copilot commands.
41	B	Input modality = whether the model must support text/image/audio/etc. for the task.
42	B	Dynamic routing across providers based on cost/latency/availability is the AI Gateway's multi-provider value.
43	A	Centralized governance/routing across models/providers is a core AI Gateway use case.
44	B	Guardrails are applied via model policy configuration to constrain content/behavior.
45	B	Policies should be updated/removed as business, cost, or governance needs evolve.
46	B	Ops/governance dashboard insights inform when/how model policies should change.
47	B	Model selection is a balance of cost, accuracy, and latency against business needs — not one factor alone.
48	B	RBAC governs both permissions and task execution rights by role.
49	B	The provided security checklist is the reference for authentication/authorization/audit readiness.
50	B	External logging feeds centralized enterprise monitoring/SIEM tools.
51	B	Built-in dashboards track conversation metrics, error rates, and performance trends.
52	B	Governance must be continuous across the full agent/assistant/workflow lifecycle.
53	B	SPbD means proactively building in data protection/access/privacy controls from the start.
54	B	Controls should be applied contextually based on scenario sensitivity/channel, not uniformly.

55	B	Environment setup includes naming conventions, regions, and resource tiers.
56	B	Backup/restore/migration support recovery and configuration consistency across environments.
57	B	Embedding model, vector DB, and indexing/retrieval parameters drive semantic search relevance.
58	B	KB security = document-level permissions and data isolation.
59	B	Approval gates ensure controlled promotion with rollback options, not unchecked auto-deploy.
60	B	Skill/tool chaining connects and sequences capabilities for complex multi-step tasks.

Scoring guide: - 54-60 correct (90%+): Exam-ready - 45-53 (75-89%): Close — review missed sections - Below 45 (<75%): Revisit the corresponding Task objectives in the study guide before testing again

Combined Score Tracker (Both Sets)

Section	Set 1 Score (/X)	Set 2 Score (/X)	Weak Area?
Sec 1 (8 Qs)	__ / 8	__ / 8	
Sec 2 (12 Qs)	__ / 12	__ / 12	
Sec 3 (8 Qs)	__ / 8	__ / 8	
Sec 4 (11 Qs)	__ / 11	__ / 11	
Sec 5 (8 Qs)	__ / 8	__ / 8	
Sec 6 (7 Qs)	__ / 7	__ / 7	
Sec 7 (6 Qs)	__ / 6	__ / 6	
Total	__ / 60	__ / 60	

Use this to spot which sections need another pass before scheduling the Pearson VUE exam.
